

**LISTING OF CLAIMS:**

- 1                    1.        (Original) A method of eliminating or reducing infection in a biological  
2 material, the method comprising removing a binding site contained in the material so that an  
3 infectious agent is prevented or inhibited from binding to the biological material.
- 1                    2.        (Original) The method of claim 1, wherein the infection is prion infection,  
2 and the infectious agent is prion protein.
- 1                    3.        (Original) The method of claim 1, wherein the biological material is  
2 bioprosthetic tissue.
- 1                    4.        (Original) The method of claim 3, wherein the structural integrity of the  
2 tissue is maintained.
- 1                    5.        (Original) The method of claim 3, further comprising contacting the  
2 bioprosthetic tissue with a preparation comprising a surfactant.
- 1                    6.        (Original) The method of claim 3, further comprising contacting the  
2 bioprosthetic tissue with a preparation comprising a surfactant and a denaturing agent.
- al 1                    7.        (Original) The method of claim 6, wherein the surfactant is Tween 80.
- 1                    8.        (Original) The method of claim 6, wherein the denaturing agent is a protic  
2 solvent.
- 1                    9.        (Original) The method of claim 8, wherein the protic solvent is an alcohol.
- 1                    10.       (Original) The method of claim 9, wherein the alcohol is ethanol or  
2 isopropanol.
- 1                    11.       (Original) The method of claim 6, wherein the preparation further  
2 comprises an cross linking agent.

1                   12.   (Original) The method of claim 11, wherein the cross linking agent is an  
2 aldehyde.

1                   13.   (Original) The method of claim 12, wherein the aldehyde is formaldehyde  
2 or glutaraldehyde.

1                   14.   (Original) The method of claim 1, wherein the infectious agent binding  
2 site is comprised of phospholipid.

1                   15.   (Original) The method of claim 14, wherein the phospholipid is selected  
2 from the group consisting of phosphatidylinositol, phosphatidylethanolamine,  
3 gangliotetraosylceramide, phosphatidylserine, phosphatidylcholine, phosphatidic acid, and  
4 sphingomyeline.

1                   16.   (Original) The method of claim 14, further comprising contacting the  
2 tissue with a preparation including a phospholipase.

1                   17.   (Original) The method of claim 1, further comprising contacting the  
2 bioprosthetic tissue with a preparation comprising formaldehyde, ethanol, and Tween 80.

1                   18.   (Original) The method of claim 2, wherein the prion protein further  
2 comprises prion-precursor protein.

a 1                   19.   (Original) The method of claim 1, further comprising a terminal  
2 sterilization step.

1                   20.   (Original) The method of claim 1, further comprising washing the tissue to  
2 promote removal of the prion protein.

1                   21.   (Original) A method of treating a biological material, the method  
2 comprising removing a binding site contained in the material so that an unwanted protein is  
3 prevented or inhibited from binding to the biological material.

1                   22.     (Original) The method of claim 21, wherein the unwanted protein is  
2 selected from the group comprising alkaline phosphatase, Thy-1, and acetylcholinesterase.

1                   23.     (Currently Amended) A method of eliminating or reducing infection in a  
2 biological material, the method comprising removing a binding site comprising ~~binding site~~ a  
3 protein or polysaccharide, contained in the material so that an infectious agent is prevented or  
4 inhibited from binding to the biological material.

1                   24.     (Original) The method of claim 23, wherein the infection is prion  
2 infection, and the infectious agent is prion protein.

1                   25.     (Original) The method of claim 23, wherein the structural integrity of the  
2 tissue is maintained.

1                   26.     (Original) The method of claim 23, further comprising contacting the  
2 bioprosthetic tissue with a preparation comprising an enzyme that digests the binding site.

1                   27.     (Original) The method of claim 26, wherein the preparation comprises  
2 heparinase, in an amount effective to remove the binding site.

1                   28.     (Original) The method of claim 23, further comprising contacting the  
2 bioprosthetic tissue with a preparation comprising a solvent, a surfactant, or a chaotropic agent in  
3 an amount effective to extract the binding site from the tissue.

al 1                   29.     (Original) The method of claim 23, further comprising contacting the  
2 bioprosthetic tissue with a preparation that chemically derivatizes a polycationic site, thereby  
3 eliminating the binding site from the tissue.

1                   30.     (Original) The method of claim 23, wherein the binding sites has binding  
2 affinity to exogenous prion protein.

1                   31.     (Original) The method of claim 23, further comprising contacting the  
2 tissue with a preparation that has binding affinity for endogenous prion protein, so that a bound  
3 complex is formed between the preparation and the endogenous prion protein.

1                   32.     (Original) The method of claim 31, further comprising a washing step to  
2 remove the bound complex from the tissue.

1                   33.     (Original) A method of eliminating or reducing infection in a bioprosthetic  
2 tissue, the method comprising blocking a binding site contained in the tissue so that an infectious  
3 agent is prevented or inhibited from binding to the binding site.

1                   34.     (Original) The method of claim 33, wherein the infection of prion  
2 infection, and the infectious agent is prion protein.

1                   35.     (Original) The method of claim 33, wherein the structural integrity of the  
2 tissue is maintained.

1                   36.     (Original) The method of claim 33, wherein the blocking step further  
2 comprises contacting the bioprosthetic tissue with a preparation comprising one or more  
3 polysulfonated polyglycosides.

1                   37.     (Original) The method of claim 36, wherein the one or more  
2 polysulfonated polyglycosides are selected from a group consisting of pentosan polysulfate,  
3 sulfated colomycin, dextran sulfate, sulfated carageenans, and heparin/heparan sulfate.

al 1                  38.     (Original) The method of claim 36, wherein the contacting step is  
2 performed at a temperature of about 37° C.

1                   39.     (Original) The method of claim 33, wherein the contacting step promotes  
2 the dissociation of prion protein from the bioprosthetic tissue.

1                   40.     (Original) A method of eliminating or reducing infection in a bioprosthetic  
2 tissue, the method comprising blocking an infectious agent so that the infectious agent is  
3 prevented or inhibited from binding to a binding site in the tissue.

1                   41.     (Original) The method of claim 40, wherein the infection is prion  
2 infection, and the infectious agent is prion protein.

1                   42.     (Original) The method of claim 40, wherein the blocking step further  
2 comprises contacting the bioprosthetic tissue with a preparation comprising a compounds  
3 selected from tetrasubstituted porphyrin, polyanionic fungal agent, congo red, fast red, trypan red  
4 and combinations thereof.

1                   43.     (Original) The method of claim 40, wherein the method is performed  
2 before, during, or after fixation.

1                   44.     (Original) The method of claim 40, wherein the method is performed  
2 during bioburden reduction.

1                   45.     (Original) The method of claim 40, wherein the method is performed  
2 during final sterilization.

1                   46.     (Original) The method of claim 40, wherein the method is performed  
2 during packaging.

1                   47.     (Original) The method of claim 46, further comprising storing the tissue in  
2 the preparation.

al 1                   48.     (Original) The method of claim 42, wherein the preparation further  
2 comprises one or more cross-linkable groups that prevent or inhibit dissociation of the one or  
3 more polysulfonated polyglycosides.

1                   49.     (Original) The method of claim 48, wherein the cross-linkable group is  
2 selected from a group consisting of lysine groups and azide moieties.

1                   50.     (Original) A method of eliminating or reducing calcification in a  
2 biological material, the method comprising removing a phospholipid calcium nucleation site  
3 contained in the material so that calcium is prevented or inhibited from binding to the biological  
4 material.

1                   51.     (Original) The method of claim 50, wherein the biological material is  
2 bioprosthetic tissue.
